

A Geometric Characterization of Parametric Cubic Curves

Shuijing (Crystal) Li

April 20, 2005

There are three types of points in cubic curves which we will consider. First, I will give the definitions of intersections, cusps and loops, along with the definition of curvature. Second, I will give some applications. Third, I will give a diagram of where such points would appear, and then another diagram of where such points would appear with trimmed cubic curves.
