

TALK 5: Endofunctors related to α -induction (FFRS §3.1)

(by Harshit Yadav)

Quick summary of last few talks:

Setting : RIBBON CATEGORY

RIBBON CATEGORY =

- \mathbb{K} -linear : $\text{Hom}_\mathcal{C}(X, Y) \in \mathbb{K}$, has \oplus - monoidal : $\otimes, \mathbb{1}$ - braided : $c_{x,y} : X \otimes Y \rightarrow Y \otimes X$

$$c_{x,y} = \begin{array}{c} y \\ \diagup \quad \diagdown \\ x \quad y \end{array} \quad c_{y,x}^{-1} = \begin{array}{c} x \\ \diagdown \quad \diagup \\ y \quad x \end{array}$$

- rigid : have left and right duals

- pivotal : left dual = right dual

denote $x^* = \text{dual of } X$ $f^* = \text{dual of } f$

left duality

right duality

(snake relations)

$$\text{tw} = f, \text{tw}^* = f^* \quad \text{tw} = f_u, \text{tw}^* = f_{u^*}$$

- ribbon : left twist = right twist

$$\text{tw} = \text{tw}^*$$

→ Idempotent : morphism $f: u \rightarrow u$ satisfying $f^2 = f$.→ We say f splits if \exists maps $r: u \rightarrow s$, $e: s \rightarrow u$ such that $u \xrightarrow{r} s \xrightarrow{e} u = f$ and $s \xrightarrow{e} u \xrightarrow{r} s = \text{id}_s$

Graphically,

$$e = \begin{array}{c} u \\ \downarrow \\ \square_s \end{array}, \quad r = \begin{array}{c} s \\ \uparrow \\ \square_u \end{array} \quad \text{satisfying} \quad \begin{array}{c} s \\ \square_s \end{array} = \text{id}_s, \quad \begin{array}{c} u \\ \square_u \end{array} = \text{id}_u$$

The triple (S, e, r) is called the retract of β .

A category \mathcal{C} is called Karoubian if all idempotents split. In this talk, the ribbon categories are not necessarily Karoubian.

Objects of study : SYMMETRIC SPECIAL FROBENIUS ALGEBRAS

It is a 5-tuple $(A, m, u, \Delta, \varepsilon)$ such that

$$\textcircled{1} \quad (A, m, u) \in \text{Alg}(e) \quad \begin{array}{c} \textcircled{1} \\ \square \\ \square \end{array} = \begin{array}{c} \textcircled{1} \\ \square \\ \square \end{array}, \quad \begin{array}{c} \textcircled{1} \\ \square \\ \square \end{array} = I = \begin{array}{c} \textcircled{1} \\ \square \\ \square \end{array}$$

$$\textcircled{2} \quad (A, \Delta, \varepsilon) \in \text{Coalg}(e) \quad \begin{array}{c} \textcircled{2} \\ \square \\ \square \end{array} = \begin{array}{c} \textcircled{2} \\ \square \\ \square \end{array}, \quad \begin{array}{c} \textcircled{2} \\ \square \\ \square \end{array} = I = \begin{array}{c} \textcircled{2} \\ \square \\ \square \end{array}$$

$$\textcircled{3} \quad \text{Frobenius condition} \quad \begin{array}{c} \textcircled{3} \\ \square \\ \square \end{array} = \begin{array}{c} \textcircled{3} \\ \square \\ \square \end{array} = \begin{array}{c} \textcircled{3} \\ \square \\ \square \end{array}$$

$$\textcircled{4} \quad \text{Symmetric} \quad \begin{array}{c} \textcircled{4} \\ A \\ A^{\vee} \end{array} = \begin{array}{c} \textcircled{4} \\ A^{\vee} \\ A \end{array}$$

$$\textcircled{5} \quad \text{Special} \quad \varepsilon \circ \eta = \begin{array}{c} \textcircled{5} \\ \square \\ \square \end{array} = \beta_{11} \text{id}_{11}, \quad m \circ \Delta = \begin{array}{c} \textcircled{5} \\ \square \\ \square \end{array} = \beta_A \text{id}_A$$

for some $\beta_{11}, \beta_A \in \mathbb{K} \setminus \{0\}$

$\textcircled{6}$ When A is symmetric special, we can normalize Δ, ε to get the relations.

$$\text{(i)} \quad \begin{array}{c} \textcircled{i} \\ \square \\ \square \end{array} = \begin{array}{c} \textcircled{i} \\ \square \\ \square \end{array}$$

$$\text{(ii)} \quad \begin{array}{c} \textcircled{ii} \\ \square \\ \square \end{array} = \begin{array}{c} \textcircled{ii} \\ \square \\ \square \end{array}$$

$$\text{(iii)} \quad \begin{array}{c} \textcircled{iii} \\ \square \\ \square \end{array} = \begin{array}{c} \textcircled{iii} \\ \square \\ \square \end{array} = \begin{array}{c} \textcircled{iii} \\ \square \\ \square \end{array}$$

$$\text{(iv)} \quad \begin{array}{c} \textcircled{iv} \\ \square \\ \square \end{array} = \begin{array}{c} \textcircled{iv} \\ \square \\ \square \end{array} = \begin{array}{c} \textcircled{iv} \\ \square \\ \square \end{array}$$

Remark about graphical calculus for symmetric Frobenius algebras in ribbon categories

The symmetric, Frobenius and (co)associativity conditions together imply that we can move multiplication and/or comultiplication past each other in all possible arrangements.

Lemma:

$$\begin{array}{c} \text{Diagram} \\ \cup \end{array} = \begin{array}{c} \text{Diagram} \\ \cap \end{array} \quad \longrightarrow \quad \textcircled{7}$$

Proof:

$$\begin{array}{c} \text{Diagram} \\ \boxed{\text{Diagram}} \end{array} \stackrel{(4)}{=} \begin{array}{c} \text{Diagram} \\ \text{Diagram} \end{array} \stackrel{(3)}{=} \begin{array}{c} \text{Diagram} \\ \text{Diagram} \end{array} \stackrel{(1), (2)}{=} \begin{array}{c} \text{Diagram} \\ \text{Diagram} \end{array} \stackrel{\text{snake relation}}{=} \begin{array}{c} \text{Diagram} \\ A^\vee \end{array}$$

Then,

$$\begin{array}{c} \text{Diagram} \\ \cup \end{array} \stackrel{\textcircled{7}}{=} \begin{array}{c} \text{Diagram} \\ \text{Diagram} \end{array} \stackrel{\text{snake relation}}{=} \begin{array}{c} \text{Diagram} \\ \text{Diagram} \end{array} \stackrel{(4)}{=} \begin{array}{c} \text{Diagram} \\ \text{Diagram} \end{array} \stackrel{(1)}{=} \begin{array}{c} \text{Diagram} \\ \text{Diagram} \end{array} \\ = \begin{array}{c} \text{Diagram} \\ \cup \end{array} \stackrel{(3)}{=} \begin{array}{c} \text{Diagram} \\ \cup \end{array} \stackrel{\textcircled{7}}{=} \begin{array}{c} \text{Diagram} \\ \cup \end{array}$$

Last time, we had defined left and right central idempotents of A

$$P_A^l = \begin{array}{c} A \\ \diagdown \quad \diagup \\ \text{---} \end{array}$$

$$P_A^r = \begin{array}{c} A \\ \diagup \quad \diagdown \\ \text{---} \end{array}$$

Next, we constructed the

- ①
 - left centre $C_e(A) = \text{retract of } P_A^l$
 - right centre $C_r(A) = \text{retract of } P_A^r$

and showed that

C_e and C_r are commutative symmetric Frobenius algebras in \mathcal{C} , and

there are natural bijections

$$\begin{aligned} \text{Hom}(C_e(A) \otimes u, v) &\cong \text{Hom}_{A\text{-}\mathcal{A}}(\alpha_A^+(u), \alpha_A^+(v)) \\ &\cong \text{Hom}(u, C_e(A) \otimes v) \\ \text{Hom}(C_r(A) \otimes u, v) &\cong \text{Hom}_{A\text{-}\mathcal{A}}(\alpha_A^-(u), \alpha_A^-(v)) \\ &\cong \text{Hom}(u, C_r(A) \otimes v) \end{aligned}$$

where $\alpha_A^\pm : \mathcal{C} \rightarrow \mathcal{C}_{A\text{-}\mathcal{A}}$ are the α -induction functors

$$\alpha_A^+ : \mathcal{C} \mapsto \left(A \otimes u, \begin{array}{c} A \otimes u \\ \diagdown \quad \diagup \\ A \quad A \otimes u \end{array} \right) := \text{Id}, \quad \begin{array}{c} A \otimes u \\ \diagup \quad \diagdown \\ A \otimes u \quad A \end{array} \stackrel{p_r^+}{=} \begin{array}{c} A \\ \diagup \quad \diagdown \\ A \quad u \end{array}$$

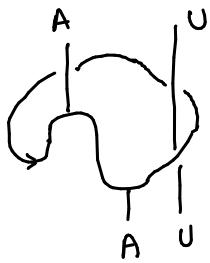

$$\alpha_A^- : \mathcal{C} \mapsto \left(A \otimes u, \begin{array}{c} A \otimes u \\ \diagup \quad \diagdown \\ A \quad A \otimes u \end{array} \right) := \text{Id}, \quad \begin{array}{c} A \\ \diagup \quad \diagdown \\ A \quad u \end{array} \stackrel{p_r^-}{=} \begin{array}{c} A \\ \diagdown \quad \diagup \\ A \quad u \end{array}$$

Today's talk is about generalizing the construction ① and the result ②

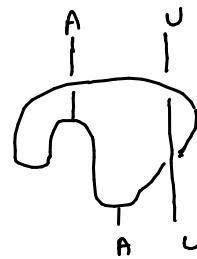

§ 3.1 Endofunctors related to α -induction

Consider the endomorphisms

$$P_A^\ell(U) =$$

$$P_A^r(U) =$$

Clearly $P_A^{\ell/\alpha}(1\!\!1) = P_A^{\ell/\alpha}$.

Just like $P_A^{H_\alpha}$, the endomorphisms $P_A^{\ell/\alpha}(U)$ are also idempotent.

Defn: A special Frobenius algebra A in a ribbon category \mathcal{C} is called centrally split if the idempotents $P_A^{\ell/\alpha}(U)$ are split for every $U \in \mathcal{C}$.

Since our ribbon categories are not necessarily Karobian, we make the following assumption.

Declaration: From here on, every special Frobenius algebra will be assumed to be centrally split.

Defn:

$$E_A^\ell(U) := \text{Im}(P_A^\ell(U)), \quad E_A^r(U) := \text{Im}(P_A^r(U))$$

Then by definition, we have maps

$$e: E_A^\ell(U) \rightarrow A \otimes U, \quad r: A \otimes U \rightarrow E_A^{\ell/\alpha}(U)$$

For $f \in \text{Hom}(U, V)$, define

$$E_A^\ell(f) :=$$

$$, \quad E_A^r(f) =$$

Lemma: Let ρ_A^\pm denote the right A -action on $A \otimes U$, then

$$(i) P_A^\pm(U) \circ \rho_A^\pm = P_A^\pm(U) \circ ([m \circ c_{A,A} \circ (\text{id} \otimes \theta_A)] \otimes \text{id}_U) \circ (\text{id}_A \otimes c_{U,A})$$

The diagram illustrates the equality between two expressions involving string operators $P_A^\pm(U)$ and ρ_A^\pm . On the left, $P_A^\pm(U)$ is at the top, followed by a crossing, then ρ_A^\pm (represented by a loop), and finally another crossing. Below this is the label 'A' under the first crossing and 'U A' under the second. An equals sign follows. On the right, $P_A^\pm(U)$ is at the top, followed by a crossing, then a loop labeled 'e' (representing $[m \circ c_{A,A} \circ (\text{id} \otimes \theta_A)]$), then another crossing, and finally $\text{id}_A \otimes c_{U,A}$. Below this is the label 'A' under the first crossing and 'U A' under the second. To the right of the diagram is the text '— (*)'.

(+ similar result for $P_A^\pm(U)$)

(ii) If A is commutative, then

$$P_A(U) \circ \rho_r^+ = P_A(U) \circ \rho_r^-$$

for $P_A(U) \equiv P_A^{e/n}(U)$.

Proof: (ii) It follows immediately from (i) by using that

$$\text{---} = \text{---}, \quad \text{---} = |.$$

(i)

The diagram shows the proof of (ii) through a sequence of string relations. It starts with the LHS of the equation, which is a complex string diagram with a red dot and a dotted path. This is followed by three equals signs and four intermediate steps. The first intermediate step shows a red dot being moved along a dotted path, with the note '(drag the red product along the dotted path)'. The second intermediate step shows a red dot being highlighted with a dashed circle, with the note '(pull the highlighted string)'. The third intermediate step shows the red dot being moved again, with the note '(pull down = again)'. The final step shows the result as $P_A^\pm(U)$, with the note '= RHS' below it.

Recall that $P_A^e(u) =$

$$\therefore r \circ P_A^e(u) = \text{Diagram} = E_A^e(u)$$

Thus, postcomposing (*) with Diagram , gives us that

$$\begin{array}{ccc} E_2^e(u) & = & E_A^e(u) \\ \text{Diagram} & & \text{Diagram} \end{array} - (**)$$

Let $F: \mathcal{C} \rightarrow \mathcal{D}$ and $G: \mathcal{D} \rightarrow \mathcal{C}$ be a pair of functors.

We call G right adjoint of F if there exists a natural family of isomorphisms

$$\phi_{x,y}: \text{Hom}_{\mathcal{C}}(F(x), y) \xrightarrow{\sim} \text{Hom}_{\mathcal{D}}(x, G(y))$$

for $x \in \mathcal{C}, y \in \mathcal{D}$

Recall the functors $\alpha_A^\pm: \mathcal{C} \rightarrow \mathcal{C}_{A/A}$

Suppose that these have right adjoints denoted as $(\alpha_A^\pm)^{ra}$ and left adjoints denoted by $(\alpha_A^\pm)^la$. Then by def'n, we get natural isomorphisms.

$$(\text{set } x = \alpha_A^+(u), y = v, F = (\alpha_A^+)^{la}, G = \alpha_A^-)$$

$$\rightarrow \text{Hom}((\alpha_A^-)^{la} \circ \alpha_A^+(u), v) \stackrel{\cong}{\leftarrow} \text{Hom}_{A/A}(\alpha_A^+(u), \alpha_v^-(v)) \cong \text{Hom}(u, (\alpha_A^+)^{ra} \circ \alpha_A^-(v))$$

(similarly for $\text{Hom}_{A/A}(\alpha_A^-(v), \alpha_A^+(v))$)

→ FFRS show that E_A^{la} can be regarded as compositions of the functors α_A^\pm and their adjoints by showing the following results.

Prop: For $U, V \in \mathcal{C}$, there are natural bijections

$$\text{Hom}(E_A^l(U), V) \cong \text{Hom}_{A\text{-}\mathcal{A}}(\alpha_A^-(U), \alpha_A^+(V)) \cong \text{Hom}(U, E_A^r(V))$$

and

$$\text{Hom}(E_A^r(U), V) \cong \text{Hom}_{A\text{-}\mathcal{A}}(\alpha_A^+(U), \alpha_A^-(V)) \cong \text{Hom}(U, E_A^l(V))$$

Proof: We will discuss the natural isomorphism

$$\text{Hom}(E_A^l(U), V) \xrightleftharpoons[\Psi_{U,V}]{\Phi_{U,V}} \text{Hom}_{A\text{-}\mathcal{A}}(\alpha_A^-(U), \alpha_A^+(V))$$

Other cases have similar proofs.

Naturality amounts to showing that $\forall u \xrightarrow{f} u', v \xrightarrow{g} v'$

$$\begin{array}{ccc} \text{Hom}(E_A^l(U), V) & \xrightarrow{\Phi_{U,V}} & \text{Hom}_{A\text{-}\mathcal{A}}(\alpha_A^-(U), \alpha_A^+(V)) \\ \downarrow \text{Hom}(E_A^l(f), g) & & \downarrow \text{Hom}_{A\text{-}\mathcal{A}}(\alpha_A^-(f), \alpha_A^+(g)) \\ \text{Hom}(E_A^l(U'), V') & \xrightarrow{\Phi_{U',V'}} & \text{Hom}_{A\text{-}\mathcal{A}}(\alpha_A^-(U'), V') \end{array} \quad (\#)$$

commutes

Definition of Φ :

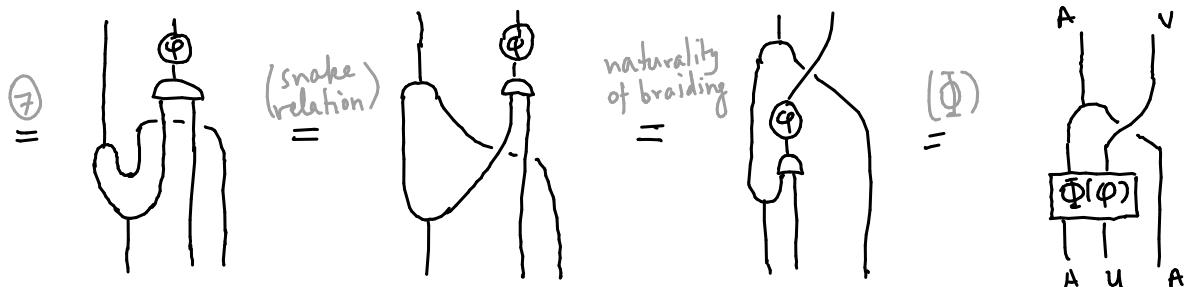

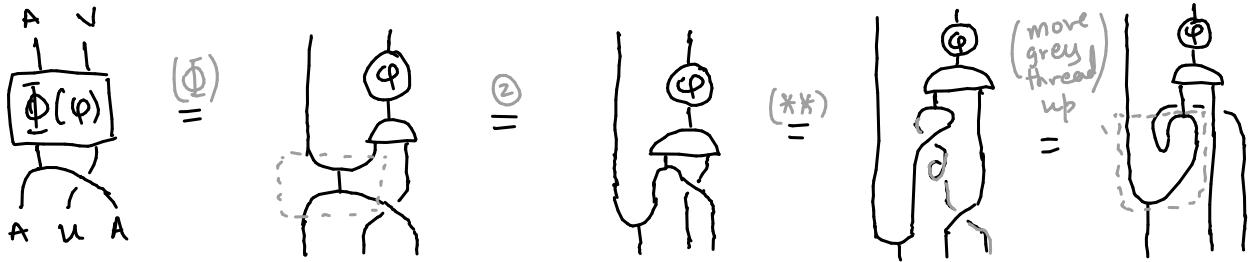

- For $\varphi : E_A^r(U) \rightarrow V$, define $\Phi_{U,V}(\varphi) = \begin{array}{c} A \\ \downarrow \varphi \\ \text{Hom}_{A\text{-}\mathcal{A}}(\alpha_A^-(U), \alpha_A^+(V)) \end{array}$: $A \otimes U \rightarrow A \otimes V$

— (Φ)

$\rightarrow \Phi_{U,V}(\varphi)$ is a morphism of left A -modules because

$$\begin{array}{ccccc} \begin{array}{c} A \\ \downarrow \Phi(\varphi) \\ A \otimes U \end{array} & = & \begin{array}{c} \varphi \\ \downarrow \end{array} & = & \begin{array}{c} \varphi \\ \text{Hom}_{A\text{-}\mathcal{A}}(\alpha_A^-(U), \alpha_A^+(V)) \\ \downarrow \end{array} \\ \begin{array}{c} A \\ \downarrow \varphi \\ V \end{array} & & \begin{array}{c} A \\ \downarrow \varphi \\ V \end{array} & & \begin{array}{c} A \\ \downarrow \varphi \\ V \end{array} \\ \begin{array}{c} A \\ \downarrow \varphi \\ A \otimes U \end{array} & & \begin{array}{c} A \\ \downarrow \varphi \\ A \otimes U \end{array} & & \begin{array}{c} A \\ \downarrow \varphi \\ A \otimes U \end{array} \end{array}$$

$\rightarrow \Phi_{u,v}(\varphi)$ is a morphism of right A -modules because

Definition of Ψ :

For $\varsigma \in \text{Hom}_{A\text{-}A}(\alpha_A^-(u), \alpha_A^-(v))$, define

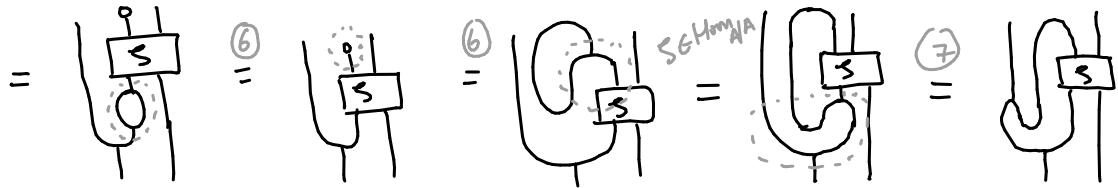

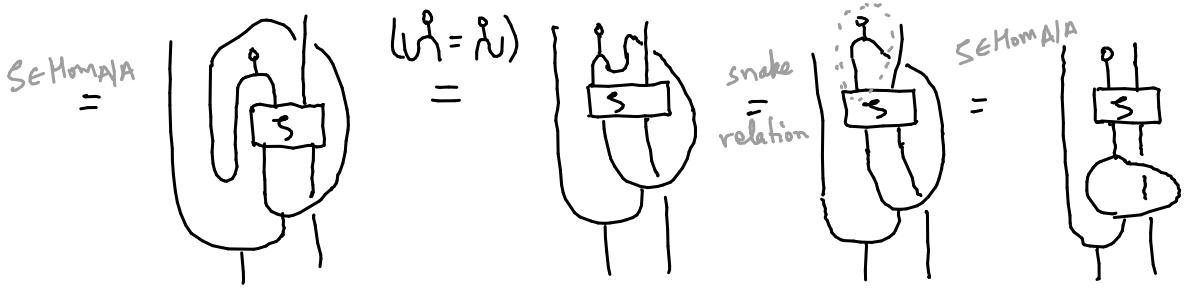

$$\Psi_{u,v}(\varsigma) = (\eta \otimes \text{id}_v) \circ \varsigma \circ e = \begin{array}{c} \circ \\ \square \text{ with } \varsigma \\ \circ \\ E_A^-(u) \end{array} - (\psi)$$

- Next, we need to check that

$$(i) \quad \Psi \circ \Phi(\varphi) = \varphi \quad \text{and} \quad (ii) \quad \Phi \circ \Psi(\varsigma) = \varsigma$$

$$(i) \quad \Psi \circ \Phi(\varphi) = \begin{array}{c} \circ \\ \square \\ \circ \\ E_A^-(u) \end{array} = \begin{array}{c} \circ \\ \square \\ \circ \\ E_A^-(u) \end{array} = \begin{array}{c} \circ \\ \square \\ \circ \\ E_A^-(u) \end{array}$$

$$(ii) \quad \Phi \circ \Psi(\varsigma) = \begin{array}{c} \circ \\ \square \\ \circ \\ E_A^-(u) \end{array} = \begin{array}{c} \circ \\ \square \\ \boxed{\varsigma} \\ \square \\ \boxed{\alpha_A^-(u)} \end{array} = \begin{array}{c} \circ \\ \square \\ \circ \\ E_A^-(u) \end{array} = \begin{array}{c} \circ \\ \square \\ \circ \\ E_A^-(u) \end{array}$$

→ Finally we are left with checking that Φ is a natural isomorphism, that is, (using diagram (#))

$$\text{Hom}_{A/A}(\alpha_A^-(f), \alpha_A^+(g)) \circ \Phi_{u,v} = \Phi_{u',v'} \circ \text{Hom}(E_A^e(f), g)$$

Let's evaluate both sides on $\varphi \in \text{Hom}(E_A^e(u), v)$

$$\begin{aligned}
 \text{LHS: } & \text{Hom}_{A/A}(\alpha_A^-(f), \alpha_A^+(g)) \circ \Phi_{u,v}(\varphi) \\
 &= \text{Hom}_{A/A}(\bar{\alpha}_A^-(f), \alpha_A^+(g)) \left[\begin{array}{c} A \\ \downarrow \\ u \end{array} \right] = \begin{array}{c} A \\ \downarrow \\ u' \end{array} \xrightarrow{f} \begin{array}{c} V' \\ \downarrow \\ u' \end{array} \xrightarrow{g} \begin{array}{c} V' \\ \downarrow \\ u' \end{array}
 \end{aligned}$$

$$\text{RHS} = \Phi_{u',v'} \circ \text{Hom}(E_A^e(f), g)(\varphi)$$

$$\begin{aligned}
 &= \Phi_{u',v'} \left(g \circ \varphi \circ E_A^e(f) \right) \\
 &= \Phi_{u',v'} \left(\begin{array}{c} V' \\ \downarrow \\ E_A^e(u') \end{array} \right) = \begin{array}{c} A \\ \downarrow \\ u' \end{array} = \begin{array}{c} A \\ \downarrow \\ u' \end{array} \xrightarrow{f} \begin{array}{c} V' \\ \downarrow \\ u' \end{array} = \text{LHS}
 \end{aligned}$$
